

The problem

Agent rooms make work fast. Regulated work makes disclosure expensive. A room is not permission to reveal sensitive context.

The solution

RoomKey adds authority-before-disclosure: block before grant, narrow the approval, revoke after use, seal the run.

1 Agent asks

A supplier
bank-change review
needs help.

2 Gate blocks

No raw banking
values enter room
history.

3 Human grants

Scope is narrow and
time-bounded.

The five moves

Agent asks → Gate blocks → Human grants scope → Safe collaboration → Revoke + seal.

Ask

Review
request
enters Band.

Block

ScopeGate
refuses raw
values.

Grant

Human
approves
scope.

Work

Agents
review safe
facts.

Seal

Replay
blocked,
receipt
kept.

What the browser verifies

The public bundle is intact, receipt shape is present, receipt hashes match, protected-value flags stayed false in this run.

Files match

Hash-pinned downloads are checked.

Receipt matches

Canonical and live receipt agree.

No leak flag

Protected values were not posted in this run.

Business value

Finance, healthcare, legal, compliance, and incident rooms can use agents without turning every room transcript into a disclosure event.

Honest boundary

This proves a receipt-pinned prototype run. It does not prove production security or independent Band-side security.
